## Telehub Communications Center

Facilitating Vendor-Neutral Central  
Patient Monitoring

*Enhance your care team's  
alarm management  
experience with  
Connexall Telehub.*

Connexall leverages proven solutions that  
improve hospital quality of care, patient  
experience, and staff satisfaction.

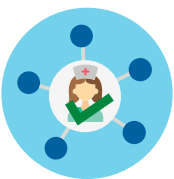

The Connexall Telehub is the industry's only vendor-neutral communications center to facilitate centralized patient monitoring. Connexall Telehub integrates the hospital's disparate patient monitors and notification systems through an on-premises or remote Central Monitoring Unit. Standardized patient information is displayed on a graphical user interface (GUI). The monitoring staff ("Tele Techs") can then acknowledge, triage, dispatch, escalate, finalize, and document events accordingly.

### Custom Configuration

Connexall's clinical and technical implementation teams will help the hospital set up the Connexall Telehub Communications Center according to the preferred workflow and escalation plan. Based on pre-set parameters, alarms are suspended, delayed, automatically routed to the appropriate resource, or a combination of these actions. When Tele Techs observe issues requiring immediate attention, they can intervene manually.

### How does this Benefit the Clinical Team?

Funneling alarms to a single GUI significantly reduces alarm fatigue and improves efficiencies for bedside nurses. Care teams only receive actionable alarms or notifications pertinent to their patients, delivered where and when they are needed for swift response and optimal care. The Connexall Telehub Communications Center ensures the right information is delivered to the right clinician at the right time.

## KEY CONNEXALL TELEHUB ADVANTAGES

### Alarm Workflow Filtering

Enables alarms routed through the Connexall Telehub Communications Center to be automated, reducing alarm fatigue by sending actionable alarms and notifications to the appropriate caregiver or resource.

### Single-Pane View

Displays standardized patient information within a single GUI.

### Care Team Collaboration

Enables multiple tiers of waveform analysis to increase patient safety.

### Prevent Interruptions

Provides a second set of eyes to facilitate alarm responses for better bedside care.

### Staff Awareness

Eliminates manual tasks and funnels information electronically to improve patient outcomes.

### Insights and Analytics

Creates greater visibility into alarms and workflow data to optimize alarm management.

See how vendor-neutral central patient monitoring future-proofs alarm management.
